Distributed Storage Systems

- Replication versus erasure coding
- MDS Codes
- Repair Bandwidth
- Regenerating Codes
 - Storage-Bandwidth tradeoff
 - Minimum-Storage Regenerating (MSR) codes
 - Minimum-Bandwidth Regenerating (MBR) codes

Extensions

- Functional repair Example
- Exact Repair Example
- Exact Uncoded Repair
- Some results

Conclusion

Replication versus erasure coding

Basics of Distributed Storage

- Reliable access to data through redundancy.
- Data stored on individually unreliable nodes.
- Should be resistant to nodes failures.
- Each system comes along with a list of failures it can handle.
- Main elements:
 - Source: gives the file to the system.
 - Nodes: store fragments of the file.
 - Data Collector (DC): want to retrieve the file.

Replication versus erasure coding

- Replication to ensure redundancy:
 - file is divided into fragments
 - each fragment stored in a node
 - each node is replicated r times

Replication versus erasure coding

- Erasure coding:
 - we can store linear combination of fragments
 - use of Maximum Distance Separable (MDS) codes
 - optimal in term of redundancy-reliability trade-off

MDS codes

Definition

If Σ is a field and $C \in \Sigma^n$ is a subspace of Σ^n , then C is said to be a *linear* code. The elements of C are called codewords. If c_1, \ldots, c_k is a basis of C, then k is the dimension of C.

C is denoted as an [n, k] code.

Definition

The *minimum distance* of a code *C*, $\Delta(C)$, is the minimum Hamming distance between two distinct codewords of *C*.

イロト 不得下 イヨト イヨト

MDS codes

Theorem (Singleton Bound)

If C is an [n, k] linear code then:

$$\Delta(C) \leq n-k+1$$

Definition

A linear code that meets the singleton bound is called a MDS (Maximum Distance Separable) code.

→ ∃ →

(1)

Erasure coding

- File of size \mathcal{M} is divided in k fragments of size \mathcal{M}/k .
- Use a [n, k] MDS code to encode k fragments into n fragments (of same size)

Theorem (MDS property)

The original file can be recovered from any set of k coded fragments.

一日、

Repair Bandwidth

- Repair process: when a node fails, we need to create a new one.
- Repair bandwidth: total bandwidth needed for the procedure.
- Replication: copy an existing replicate.
 - Repair bandwidth : \mathcal{M}/k
- Erasure coding: naive method
 - Recreate the whole file and then create a new fragment.
 - Repair bandwidth: \mathcal{M} .
 - *Exact* repair: we replace with same node.
 - Functional repair: only maintain the MDS property.

Regenerating Codes - Notations

- We consider a [n, k] linear code over finite field \mathbb{F}_q .
- Each node stores α bits.
- A new node connects to d nodes, k ≤ d ≤ n − 1.
- A new node downloads β bits from each node.
- The repair bandwidth is $\gamma = d\beta$.

イロト イポト イヨト イヨト

Storage-Bandwidth tradeoff

Theorem (Regenerating Codes)

The points $(n, k, d, \alpha, \gamma)$ are feasible iif $\alpha \ge \alpha^*(n, k, d, \gamma)$, ^a where

$$\alpha^{*}(n,k,d,\gamma) = \begin{cases} \frac{\mathcal{M}}{k} & \gamma \in [f(0), +\infty) \\ \frac{\mathcal{M}-g(i)\gamma}{k-i} & \gamma \in [f(i), f(i-1)) \end{cases}$$

$$f(i) \triangleq \frac{2\mathcal{M}d}{(2k-i-1)i+2k(d-k+1)}$$

$$g(i) \triangleq \frac{(2d-2k+i-1)i}{2d}, \text{ with } i < k$$

$$(2)$$

Codes that achieve $\alpha = \alpha^*(n, k, d, \gamma)$ are called regenerating codes.

Storage-Bandwidth tradeoff

Corollary

For d, n, k given, the minimum repair bandwidth γ is given by:

$$\gamma_{\min} = f(k-1) = \frac{2\mathcal{M}d}{2kd - k^2 + k}$$
(3)

Important observation: $\gamma = d\beta$ decreasing function of d.

- 4 同 6 4 日 6 4 日 6

Storage-Bandwidth tradeoff

Proof (sketch).

Let us define the information flow graph:

The min-cut needs to be at least the object size $\ensuremath{\mathcal{M}}.$ Use results from network coding.

Important: need a very large field size (which depends on the graph size).

Figure: Optimal tradeoff curve between α and γ for k = 10, n = 15 with $\mathcal{M} = 1, d = n - 1$. Traditional erasure coding is ($\gamma = 1, \alpha = 0.1$). (From Dimakis *et al*, 2010)

Minimum-Storage Regenerating (MSR) codes

• MSR codes are obtained by minimizing α :

$$(\alpha_{MSR}, \gamma_{MSR}) = \left(\frac{\mathcal{M}}{k}, \frac{\mathcal{M}d}{k(d-k+1)}\right)$$
 (4)

- If d = k, then $\gamma_{MSR} = \mathcal{M}$: cannot avoid naive method.
- If d = n 1, $\gamma_{MSR}^{\min} = \frac{M}{k} \cdot \frac{n-1}{n-k}$
- Equivalent with MDS codes.

Minimum-Bandwidth Regenerating (MBR) codes

• MBR codes are obtained by minimizing γ :

$$(\alpha_{MBR}, \gamma_{MBR}) = \left(\frac{2\mathcal{M}d}{2kd - k^2 + k}, \frac{2\mathcal{M}d}{2kd - k^2 + k}\right)$$
(5)

- Note that $\alpha_{MBR} = \gamma_{MBR}$.
- If d = n 1, $\alpha_{MBR}^{\min} = \gamma_{MBR}^{\min} = \frac{M}{k} \cdot \frac{2n-2}{2n-k-1}$
- We have to allow a little more storage in order to decrease the repair bandwidth.

Functional repair - Example ¹

Example for a [4,2] MSR code with $\mathcal{M}=2$ Mb.

Repair bandwidth: 1.5 Mb. This code is also optimal as $\frac{M}{k}\frac{n-1}{n-k} = 1.5$ Mb and $\frac{M}{k} = 0.5$ Mb .

Exact Repair - Example²

- DSS (Distributed Storage System) description: [n, k, d] = [5, 3, 4]
- MDS code: (10,9) parity-check code
- Nodes: *v*₁,...,*v*₅.
- Achieves the storage-bandwidth tradeoff: MBR code.

Exact Uncoded Repair ³

- When read/write bandwidth of the nodes is the bottleneck of the system.
- Uncoded repair: survivor node reads only the data he sends.
- No network coding.
- Allow for a *repair table*:
 - available at all time
 - describe any recovery procedure: who should be contacted and what should they give
 - network complication
- General construction: concatenation of a MDS code and a *fractional repair* code.

Conclusion

- 'Regenerating codes' reduce the repair bandwidth while maintaining the optimality of redundancy-reliability.
- This reduction comes along with a augmentation of the storage.
- Construction techniques have been developed for some (but not all) possibilities.
- Many possible application: storage in wireless sensor networks, data centres...
- But yet no existing system as some issues still need to be handled: data integrity, security...
